SATELLITE STRAIGHTENING SET

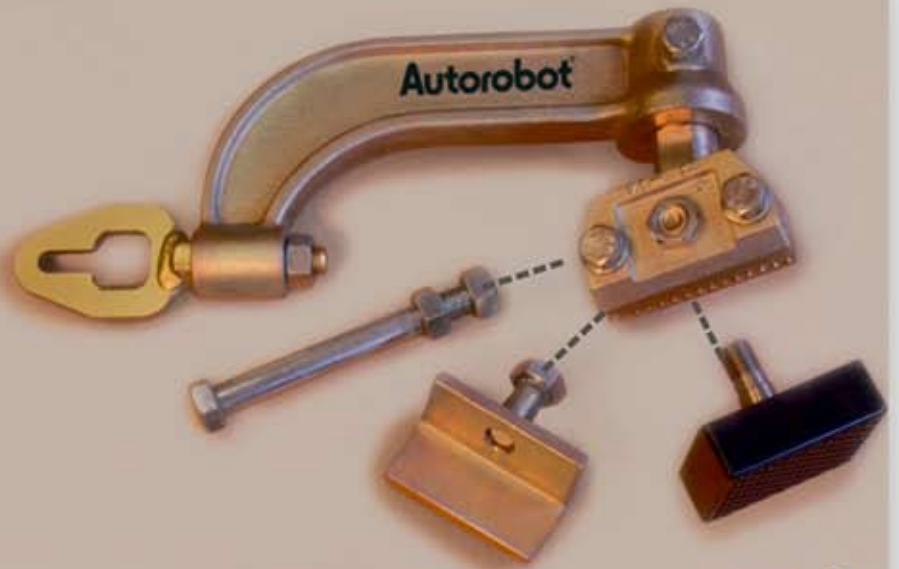

**Technology
from FINLAND**

Dataliner®

The modular Satellite straightening set is designed for bodyshops who want to be the best in their field and make a good profit.

Satellite 714B basic part rotates and reaches automatically the most ideal pulling direction.

714B

Pat.pend.

The modules of the Satellite straightening set are made of the best material and can handle the strongest vehicle structures without trouble. The inexpensive Satellite set is a very economical solution because of its versatile use. Several types of accessories can be attached to the moulded, rotating straightening arm.

Additional sets for Satellite straightening set

Set No. 714+2B is suitable for almost any car.

Dataliner®

Using Satellite optional sets to straighten strong structured vehicle body parts.

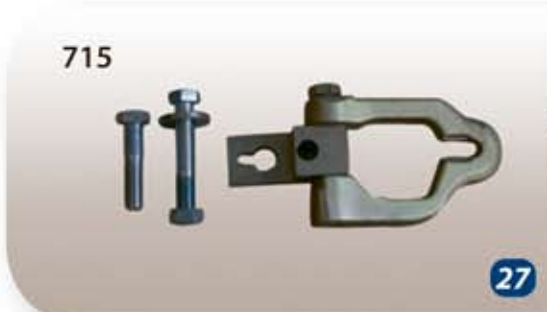

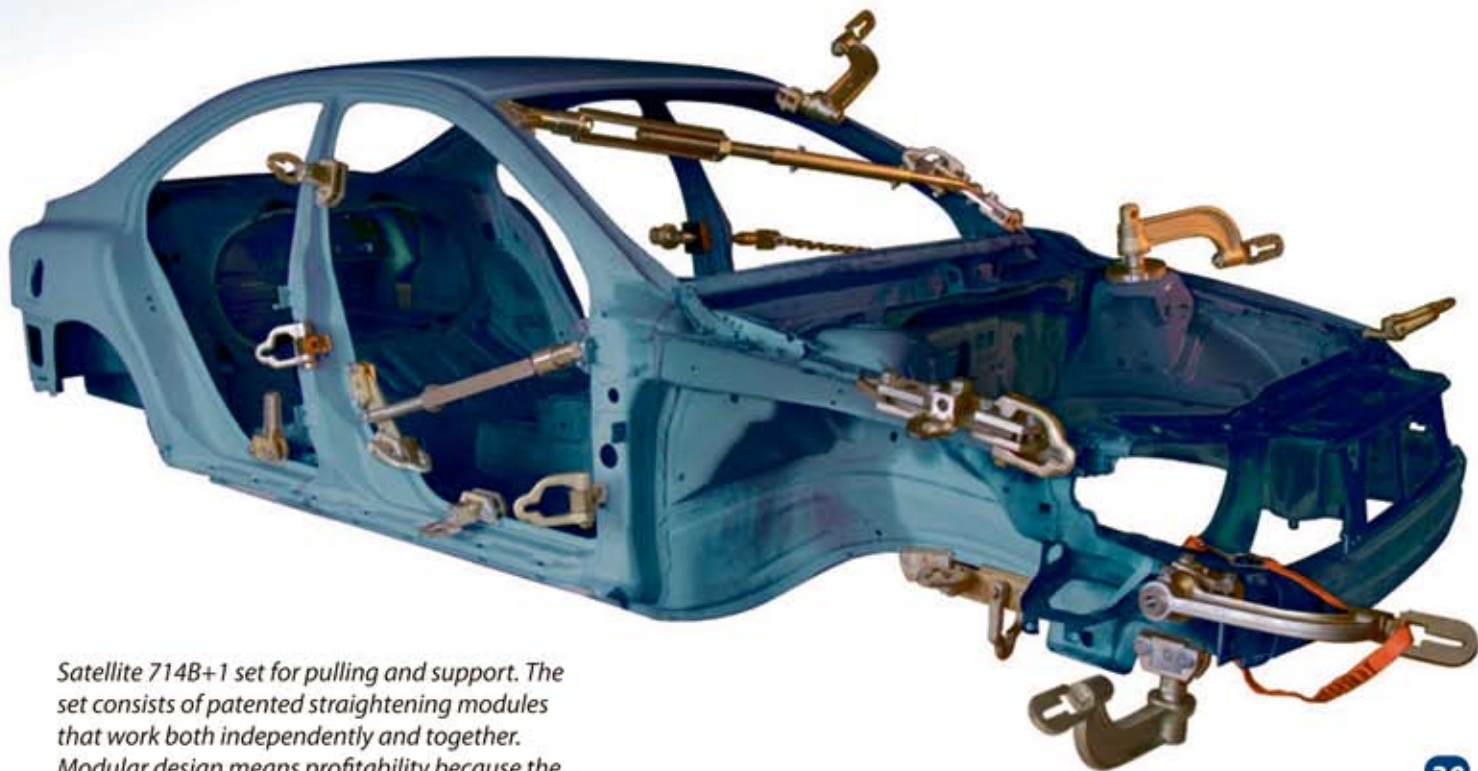

In line straightening of the strong-structured B pillar often requires a hydraulic pull together with a simultaneous mechanical push.

The B pillar straightens out more easily, if a support is placed at the damaged point. The support equipment shown in the picture can also be used in other kinds of straightening jobs.

714B+1+2

Satellite 714B+1 set for pulling and support. The set consists of patented straightening modules that work both independently and together. Modular design means profitability because the bodyshop now doesn't need to purchase separate tool sets for each purpose.
